$$\begin{array}{c} x - y^{2} \\ y = 2x^{2} + 3x \end{array}$$

$$\begin{array}{c} y = 2x^{2} + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} \end{array}$$

$$\begin{array}{c} y = 2x + 2ax + a^{2} = 2x + a$$

1.1 Funcionales lineales

Definición 1.1.1 Sea V un espacio vectorial sobre \mathbb{F} . Entonces, una transformación lineal

$$f: V \mapsto \mathbb{F}$$

es un funcional lineal sobre V.

Ejercicio 1.1 Sean $\alpha_1,...,\alpha_n \in \mathbb{R}$. Definimos:

$$\Phi: \mathbb{R}^n \mapsto \mathbb{R} \ni$$

$$\Phi(x_1,...,x_n)=\alpha_1x_1+...+\alpha_nx_n$$

 $\Rightarrow \Phi$ es funcional lineal.

Nota 1.1.

$$f: \mathbb{R}^2 \mapsto \mathbb{R} \ni$$

$$\Phi(x,y) = 2x - y$$

Ejercicio 1.2 Sea C[0,1] un conjunto de funciones continuas en [2,1] y considere:

$$T:C[0,1]\mapsto \mathbb{R}\ni$$

$$T(g) = \int_0^1 g(x)dx$$

Nótese si $f,g \in [0,1]$ y $\alpha \in R \Rightarrow T(\alpha f + g) = \int_0^1 [\alpha f + g](x) dx = \int_0^1 [(\alpha f)(x) + g(x)] dx = \alpha \int_0^1 f(x) dx + \int_0^1 g(x) dx = \alpha T[f] + T[g] \Rightarrow \text{es lineal} \Rightarrow T \text{ es funcional lineal.}$

Ejercicio 1.3 Sea

$$d: \mathbb{R}^{nxn} \mapsto \mathbb{R} \ni$$

d(A) = determinante de A

Recordar que:

$$det(A+B) \neq det(A) + det(B)$$

 $det(\alpha A) \neq \alpha det(A)$
 $d(A)$ no es funcional lineal

Ejercicio 1.4 Sea

$$T:\mathbb{R}^{nxn}\mapsto\mathbb{R}\ni$$

$$T(A) = \text{traza de A}$$

Si
$$A = [a_{ij}] \Rightarrow Tr(A) = \sum_{i=1}^{n} a_{ij}$$

 $\Rightarrow Tr(A)$ es funcional lineal.

Ejercicio 1.5 Sea V el espacio de todas las funciones sobre \mathbb{R} . Definimos

$$C_t: V \mapsto \mathbb{R} \ni$$

 $C_t(f) = f(t)$, donde t es un número fijo.

Nótese que:

- 1. Sea $f, g \in V \Rightarrow L_t[f+g] = (f+g)(t) = L_t(f) + L_t(g)$ 2. Sea $\alpha \in \mathbb{R} \mapsto L_t(\alpha f) = (\alpha f)(t) = \alpha f(t) = \alpha L_t(f) \Rightarrow$ Es funcional lineal.

Nota 1.2. Considere el funcional lineal

$$f: \mathbb{R}^n \mapsto \mathbb{R} \ni$$

$$f(x_1,...,x_n) = \alpha_1 x_1 + ... + \alpha_n x_n.$$

$$\alpha_1 \in \mathbb{R}$$

(fijos) Sea $B = \{e_1, ..., e_n\}$ la base usual de \mathbb{R}^n y sea $B' = \{1\}$ la base usual de \mathbb{R} .

$$f(1,0,...,0) = \alpha_1(1) + \alpha_2(0) + ... + \alpha_1(0)$$

$$= \alpha_1$$

$$f(0,1,0,...,0) = \alpha_2$$

$$\vdots$$

$$\Rightarrow [f]_B^{B'} = [\alpha_1 \alpha_2 ... \alpha_n]$$

Nota 1.3. Si f son funcionales lineales.

$$f \in f[V, \mathbb{F}] \text{ si } dim(V) = n$$

 $\Rightarrow dim(f[V, \mathbb{F}]) = n \cdot 1 = n$

Definición 1.1.2 — V^* . Al espacio de funciones lineales de V es \mathbb{V} es \mathbb{F} se le llama al espacio dual de V.

Nota 1.4. Si $dim(V) = n \Rightarrow dim(V^*) = n$

1.1.1 Teorema

Teorema 1.1.1 Sea V un espacio vectorial finito dimensional y $B = \langle v_1, ..., v_n \rangle$ una base ordenada de V. Entonces, existe una base: $B^* = \{\Phi_1, ..., \Phi_n\}$ de V^* , tal que:

$$\Phi_i(V_j) = \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases} = \delta_{ij}$$

$$\Phi_i(V_j) = \delta_{ij} \xleftarrow{ ext{Delta de Kronecker}}$$

1.1.2 Ejercicio

Ejercicio 1.6 Considere la base de \mathbb{R}^2 ,

$$B = \{(2,1),(3,1)\}$$

entonces, encuentre una base para para $(\mathbb{R}^{\nvDash})^* \xleftarrow{\mathscr{L}[\mathbb{R}^2,\mathbb{R}^2]}$

Solución:

$$B^* = \{\phi_1, \phi_2\}$$
 es tal que: (1.1)

Debemos encontrar $\alpha_1, \alpha_2, \beta_1, \beta_2$

$$\phi_1(x, y) = \alpha_1 x + \alpha_2 y \tag{1.2}$$

$$\phi_2(x, y) = \beta_1 x + \beta_2 y \tag{1.3}$$

Encontramos $\alpha_1 y \alpha_2$:

$$\phi_1(v_1) = \phi(2,1) = 2\alpha_1 + \alpha_1 = 1 \qquad \delta_{11} \qquad (1.4)$$

$$\phi_1(v_2) = \phi(3,1) = 3\alpha_1 + \alpha_2 = 0 \qquad \delta_{11} \qquad (1.5)$$

$$\implies \alpha_1 = -1, \alpha = 3$$
 (1.6)

$$\Longrightarrow \phi_1(x, y) = -x + 3y \tag{1.7}$$

Encontramos B_1, B_2 :

$$\phi_2(\nu_1) = \phi_2(2,1) = 2\beta_1 + \beta_2 = 0 \tag{1.8}$$

$$\phi_2(\nu_2) = \phi_2(3,1) = 3\beta_1 + \beta_2 = 1 \tag{1.9}$$

$$\Longrightarrow \beta_1 = 1, \beta_2 = -2 \tag{1.10}$$

$$\Longrightarrow \phi_2(x,y) = x - 2y \tag{1.11}$$

 \implies La base dual de B, denotada por B^* (i.e. la base del espacio dual V^*), es $B^* = \{-x + 3y, -x + 2y\}$

1.1.3 Ejercicio

Ejercicio 1.7 Dada la base de \mathbb{R}^3 :

$$B = \{(1, -1, 3), (0, 1, -1), (0, 3, -2)\},\$$

encuentre la base dual de B^* (i.e. la basa para $\mathscr{L}[\mathbb{R}^3,\mathbb{R}]$)

$$\phi_1(x, y, z) = \alpha_1 x + \alpha_2 y + \alpha_3 z \tag{1.12}$$

$$\phi_2(x, y, z) = \beta_1 x + \beta_2 y + \beta_3 z \tag{1.13}$$

$$\phi_3(x, y, z) = \gamma_1 x + \gamma_2 y + \gamma_3 z \tag{1.14}$$

Encontramos $\alpha_1, \alpha_2, \alpha_3$:

$$\phi_1(v_1) = \phi_1(1, -1, 3) = \alpha_1 - \alpha_2 + 2\alpha_3 = 1 \tag{1.15}$$

$$\phi_2(v_2) = \phi_1(0, 1, -1) = 0\alpha_1 + \alpha_2 - 1\alpha_3 = 0 \tag{1.16}$$

$$\phi_3(v_3) = \phi_1(0, 3, -2) = 0\alpha_1 + 3\alpha_2 - 2\alpha_3 = 0 \tag{1.17}$$

$$\implies \alpha_1 = 1, \alpha_2 = \alpha_3 = 0 \implies \phi_1(x, y, z) = x \tag{1.18}$$

Encontramos $\beta_1, \beta_2, \beta_3$:

$$\phi_2(v_1) = \phi_2(1, -1, 3) = 1\beta - 1\beta + 2\beta = 0 \tag{1.19}$$

$$\phi_2(v_2) = \phi_2(0, 1, -1) = 0\beta + 1\beta - 1\beta = 1 \tag{1.20}$$

$$\phi_2(\nu_3) = \phi_2(0, 3, -2) = 0\beta + 3\beta - 2\beta = 0 \tag{1.21}$$

$$\implies \beta_1 = 7, \beta_2 = -2, \beta_3 = -3 \implies \phi_2(x, y, z) = 7x - 2y - 3z \tag{1.22}$$

Encontramos $\gamma_1, \gamma_2, \gamma_3$

$$\phi_3(v_1) = \phi_3(1, -1, 3) = 1\gamma - 1\gamma + 2\gamma = 0 \tag{1.23}$$

$$\phi_3(\nu_2) = \phi_3(0, 1, -1) = 0\gamma + 1\gamma - 1\gamma = 1 \tag{1.24}$$

$$\phi_3(v_3) = \phi_3(0, 3, -2) = 0\gamma + 3\gamma - 2\gamma = 0 \tag{1.25}$$

$$\Longrightarrow \gamma_1 = 2, \gamma_2 \gamma_3 = 1 \Longrightarrow \phi_3(x, y, z) = -2x + y + z \tag{1.26}$$

Por lo tanto:

$$B^* = \{x, 7x - 2y - 3z, -2x + y + z\}$$
(1.27)

Por otra parte, es necesario probar que B^* es linealmente independiente

Considere:
$$v_1 \phi_1 + v_2 \phi_2 + ... + v_n \phi_n = 0$$
 (1.28)

A probar:
$$v_1 = v_2 = ... = v_n = 0$$
 (1.29)

Sea $v_i \in B$, $1 \le i \le n$

$$\Longrightarrow (\upsilon_1 \phi_1 + \ldots + \upsilon_1 \phi_i + \ldots + \upsilon_n \phi_n)(\upsilon_i) = 0(\upsilon_i)$$
(1.30)

$$\implies v_1 \phi_1(v_i) + \dots + v_1 \phi_i(v_i) + \dots + v_n \phi_n(v_i) = 0$$
 (1.31)

$$\Longrightarrow 0+1+0 = 0 \tag{1.32}$$

$$\implies v_1 = v_2 = \dots = v_n = 0 \implies \{\phi_1, \dots, \phi_n\}$$
 es linealmente independiente (1.33)

(1.34)

1.1.4 Teorema

Teorema 1.1.2 Sea V un espacio vectorial finito dimensiona y sea $B = \{x_1,...,x_2\}$ una base ordenada para V. Entonces existe una base $B^* = \{\phi_1,...,\phi_n\}$ para $V^* \ni$

$$\phi_i(x_j) = \delta_i j$$

Además,

$$(i)\forall \phi \in V^*$$
, se tiene: (1.35)

$$\phi = \phi(x_1)\phi_1 + \phi(x_2)\phi_2 + \dots + \phi(x_n)\phi_n \tag{1.36}$$

$$(ii) \forall x \in V$$
, se tiene que: (1.37)

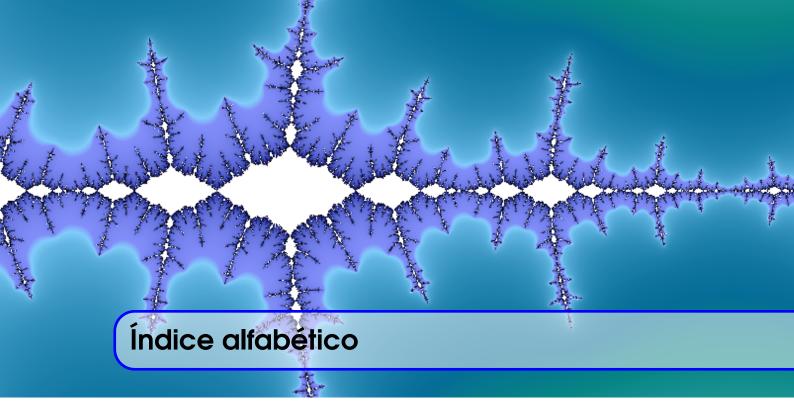

$$x = \phi_1(x)x_1 + \phi_2(x)x_2 + \dots + \phi_n(x)x_n$$
(1.38)

(1.39)

Demostración.

A probar: B^* es linealmente independiente. Considere:

$$\alpha_1 \phi_1 + \ldots + \alpha_n \phi_n ? \tag{1.40}$$

Е
